Professional Summary

Pragmatic Fullstack Developer with 4+ years building business-critical web services in Go and Node.js, with a strong backend focus and hands-on frontend experience in React and Vue. Proven track record delivering customer-facing portals and B2B integrations end-to-end: REST APIs on Fiber/Echo with GORM and PostgreSQL, JWT authentication, payment and mortgage integrations, internal CRM/ERP document workflows, and SPA-to-SSR migrations. Experienced in evolving monolithic services into microservices on gRPC, hardening reliability with RabbitMQ-backed queues, and containerizing the full stack with Docker and Nginx. Remote-first, available for full-time roles, ready to own product features from API design to production delivery.

Key Achievements

- **Customer Portal at Scale:** Built and grew the customer account portal at DOGMA from a Go MVP into a feature-rich product covering apartment search, paid online reservations integrated with an online cash register and fiscalization provider, and online mortgage origination integrated with multiple banking APIs.
- **Monolith → Microservices:** Refactored the customer portal monolith into focused Go microservices (deals service, upstream-CRM mirror service) communicating over gRPC, lifting reliability and enabling independent deployments.
- **Resilience via Messaging:** Introduced RabbitMQ as the backbone for talking to internal CRM, internal ERP, and third-party APIs — eliminating data-loss scenarios on outages and decoupling external integrations from request paths.
- **Data Migration:** Designed and ran an automated migration of the apartment catalog from a legacy CRM into PostgreSQL, enabling fast filtered search and unblocking modern UX features.
- **API Tooling:** Stood up a documented REST API on Fiber with Swaggo-generated OpenAPI specs, JWT auth/refresh middleware, GORM-backed PostgreSQL access, and Gothenberg-driven PDF generation; consolidated this stack as the template for new internal services.

Professional Experience

DOGMA — Backend Developer — Sep 2019 — Jan 2024

Real-estate developer; in-house portfolio of customer, agency and counterparty portals integrated with the company's internal CRM and ERP systems

- Started full-stack on Node.js / Express with React and Vue: redesigned company landing pages and the main site, migrated from a SPA to SSR for faster first paint and SEO, and moved hosting from static web-hosting to Dockerized services behind Nginx.
- Transitioned fully to Go backend: launched the company's first Go service — an apartment catalog with filtered search — and ran an automated migration of apartment data from the legacy CRM into PostgreSQL.

- Built the customer account portal in Go: JWT authentication, SMS-code registration via a third-party SMS gateway, favorites, and live status of the customer's deals from the upstream CRM.
- Delivered paid online apartment reservations (4-day hold) integrated with an online cash register API and a fiscal-data provider for receipts.
- Implemented online mortgage origination inside the customer portal, integrated with multiple banking APIs covering different lenders.
- Built the counterparty portal: deal status, and electronic document workflow with the company's internal ERP system for counterparty accreditation.
- Designed and shipped the realtor-agency portal: REST API initially on Echo, later migrated to Fiber for throughput; OpenAPI documentation via Swaggo; JWT auth-token + refresh-token middleware; PostgreSQL access through GORM; PDF generation via Gothenberg.
- Released a translation service used by mobile and frontend teams across the company.
- Adopted RabbitMQ for asynchronous communication with internal CRM, internal ERP, and third-party APIs, improving fault tolerance for bursty and unreliable upstreams.
- Refactored the customer portal monolith into Go microservices (deals service, upstream-CRM mirror service) communicating over gRPC.
- Onboarded one frontend engineer and one backend engineer; transferred ownership of legacy areas.

ShtrafovNet.ru — Backend Developer — Feb 2024 — Apr 2024

Service for tracking and resolving traffic fines

- Built and refactored the REST API powering the public website and the web application.
- Streamlined endpoint contracts and internal data flows for faster, more predictable response times.

Technical Skills

Programming Languages: Go, JavaScript, TypeScript **Backend:** Go (Fiber, Echo, GORM), Node.js, Express, JWT (auth-token + refresh-token), OpenAPI/Swagger via Swaggo, Gothenberg (PDF generation), gRPC **Frontend:** React, Vue, HTML, CSS **Databases & Caching:** PostgreSQL, MySQL, MongoDB, Redis **Messaging & RPC:** RabbitMQ, gRPC, REST API **APIs & Integrations:** internal CRM, internal ERP (accreditation, document workflow), banking APIs, online cash register / fiscal-data providers, SMS gateways, generic third-party REST APIs **DevOps & Tooling:** Docker, Nginx, Linux, Git, SSR migration

Education

KAIT 20 — College of Automation and Information Technologies — 2015 Industrial Automation Systems

Languages

- Russian — Native
- English — B1 (Intermediate)

Additional Information

- **Availability:** Immediately available for Backend / Fullstack Developer roles at product companies.
- **Work Preferences:** Remote-first, full-time. Not available for business trips.

- **Target Stack:** Go services, REST/gRPC APIs, PostgreSQL/Redis, RabbitMQ, Docker, with frontend on React or Vue when needed.
